

Figure 5: Interpreted non-migrated sparker single channel seismic reflection profile from USGS data set 19236 (description and maps in Burdick and Richmond, 1982). The top profile is highly vertically exaggerated. Below, the interpreted layers are shown with no vertical exaggeration at the seafloor. Because the limb width is about the same for strata of different age, it does not make sense for slip to be equal to limb width on this structure.
